

Oven Temperature Not Accurate

Diagnostic Checklist

Step 1: Verify with oven thermometer (set 350F, wait 20min after preheat)

Step 2: Try calibration offset (hold Bake button for model instructions)

Step 3: Test temperature sensor resistance (~1000-1100 ohm at room temp)

Step 4: Inspect bake element for dark spots / uneven glow during preheat

Step 5: Check door gasket seal (dollar-bill pull test around all edges)

Step 6: Watch gas igniter - should glow bright white in <90 seconds

Step 7: Control board if all above pass and offset won't calibrate far enough
